4C | FOUR CORNERS · DESIGN PREVIEW

OnTrack

Maintenance tickets, equipment history, contractors and monthly walkthroughs for every restaurant, in one app.

OnTrack is a design for how 4C | Four Corners could run maintenance across its four restaurants. Every screen in this deck is a working prototype you can click through.

Prepared for the operations team · October 2026

WHERE WE START

Issue tracking is only one piece

How you use EcoTrak today

Restaurants log issues and the team tracks them to done.

Equipment, contractors and walkthroughs aren’t part of how it’s used.

What OnTrack adds

Equipment
Every unit with its repair history, cost and QR label

Contractors
One directory with visits, spend and invoices

Monthly walkthroughs
A shared checklist for every restaurant

Spend visibility
Cost by ticket, unit, contractor and restaurant

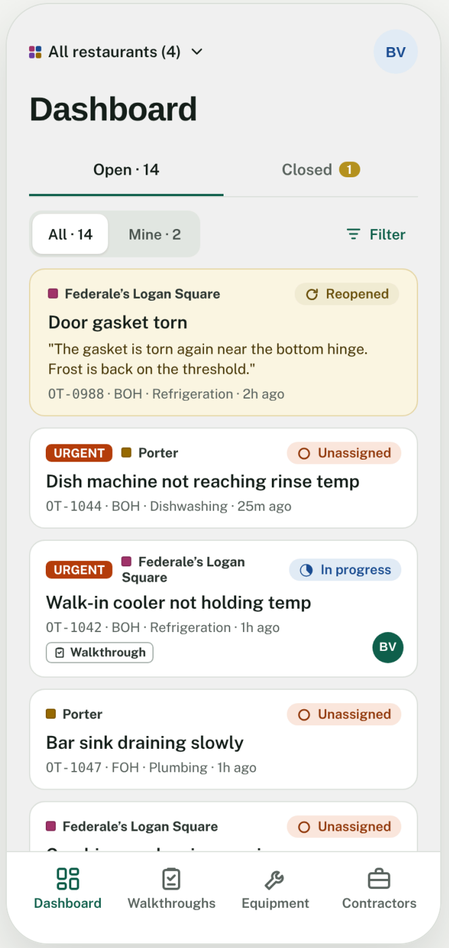

YOUR DAY IN ONTRACK

Every restaurant’s open work on one screen

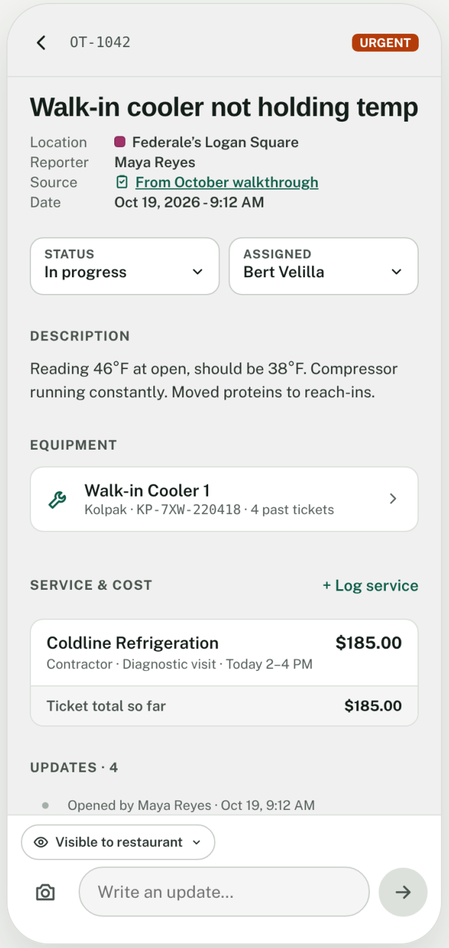

Urgent first. Each restaurant has its own color, so you can scan the list fast.

Filter by status, area, category, urgency or walkthrough tickets.

One ticket, one thread. Assign it, update status and message the restaurant in one place.

Ops dashboard

Ticket detail

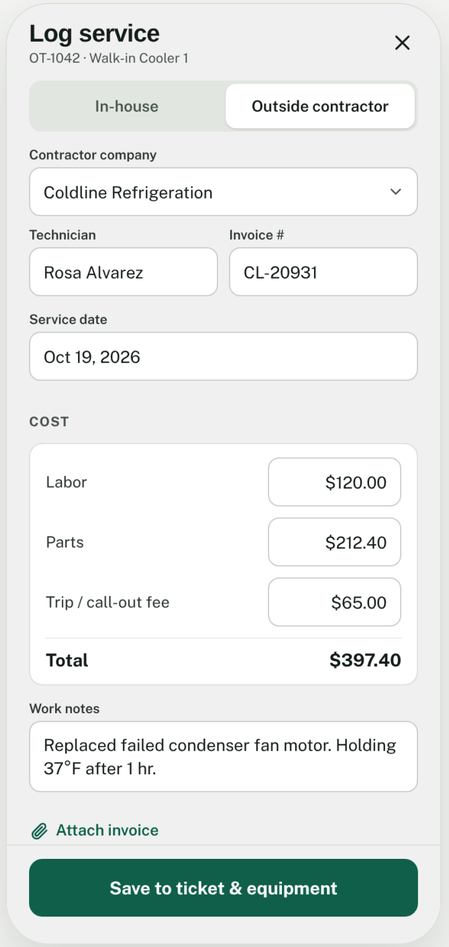

WHERE THE MONEY GOES

Log each repair’s cost while it’s fresh

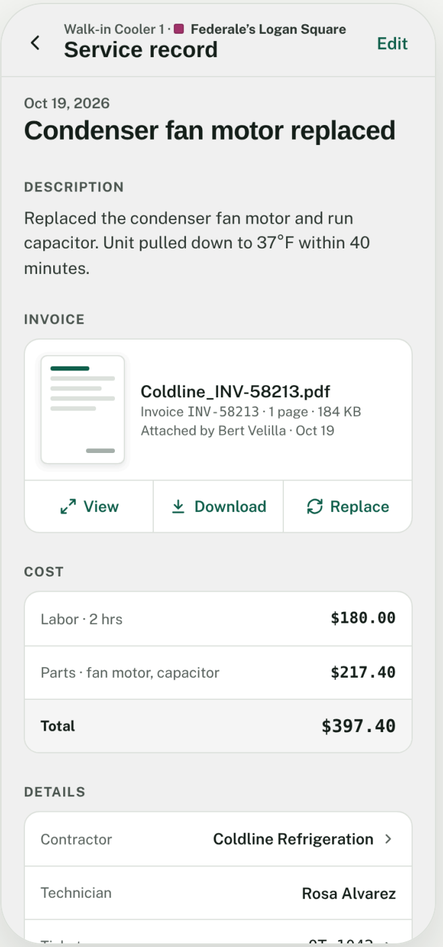

In-house or contractor, with labor, parts and trip fees broken out.

Attach the invoice so it lives with the ticket and the unit, not in an inbox.

Missing invoices are flagged so someone follows up.

Log service & cost

Service record

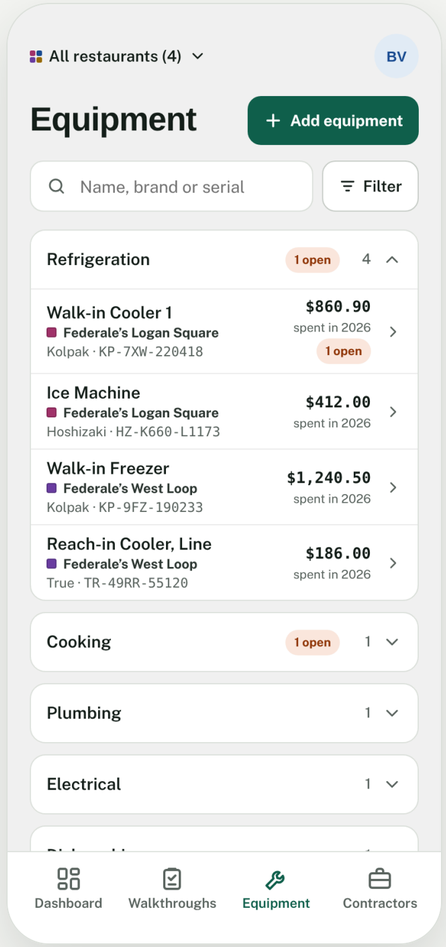

WHERE THE MONEY GOES

Every unit keeps its own history

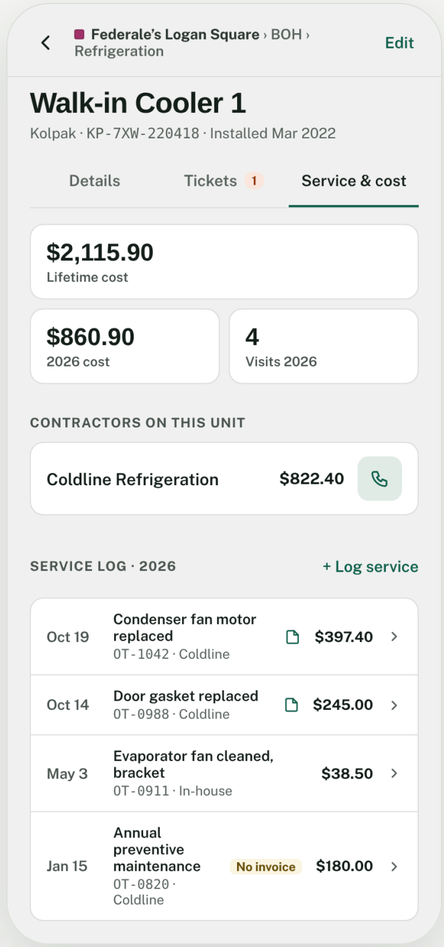

See this year's spend on every unit across all restaurants, so the costly ones stand out.

Open one for its full repair log and lifetime cost, to back up repair-or-replace calls.

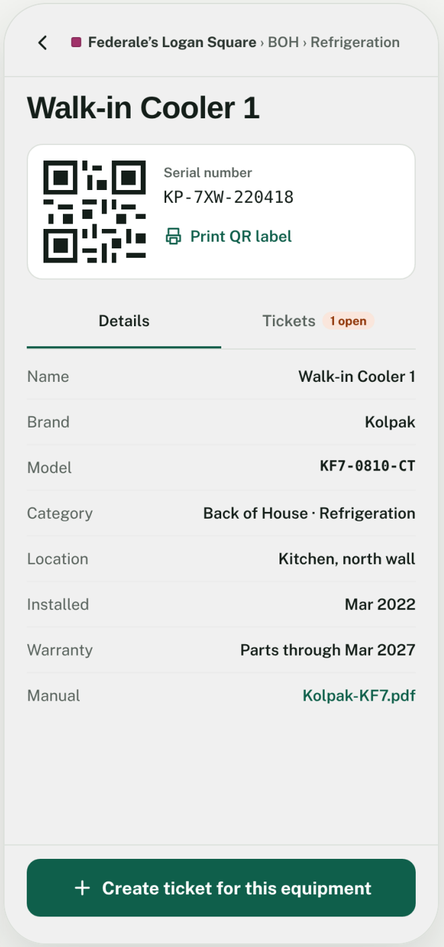

A QR label on each unit brings up its details or starts a ticket tied to it.

Equipment list

Service & cost

Details after a QR scan

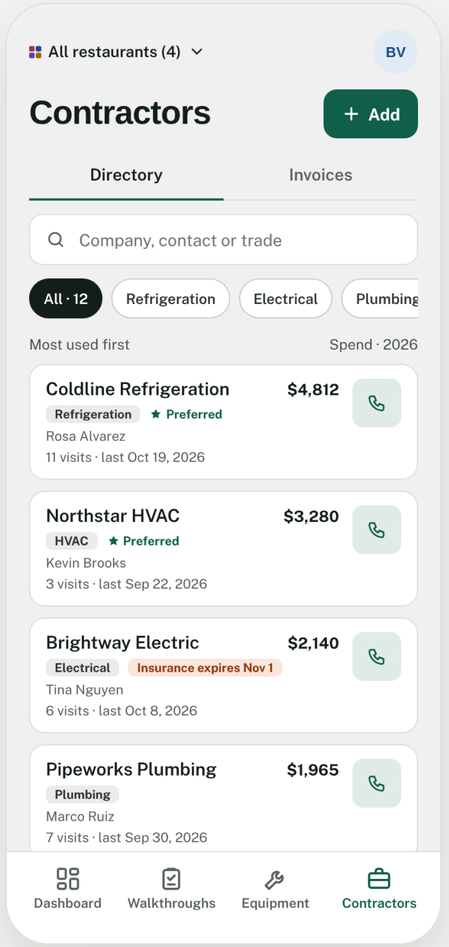

WHERE THE MONEY GOES

Contractors, spend and invoices in one place

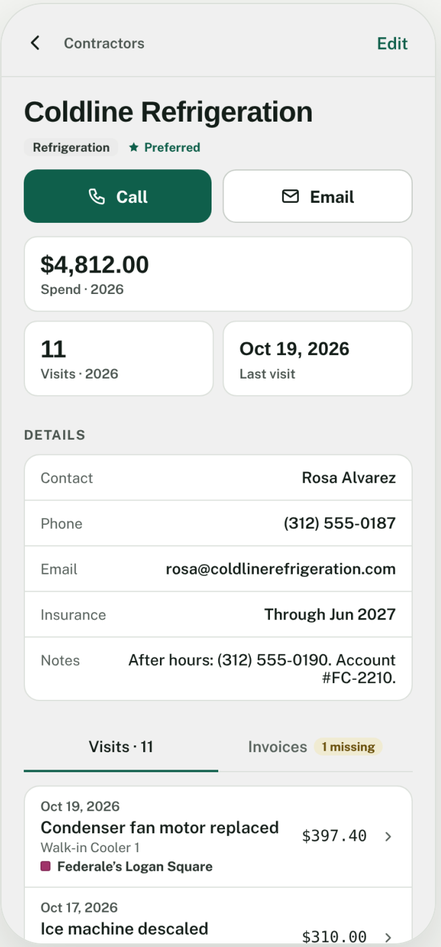

One tap to call the right contractor for any trade, with preferred vendors marked.

Spend and visits per contractor across all restaurants.

Expiring insurance and missing invoices show up before they become a problem.

Contractor directory

Contractor detail

THE THREAD THAT TIES IT TOGETHER

Every repair links to a restaurant, a unit, a contractor and an invoice.

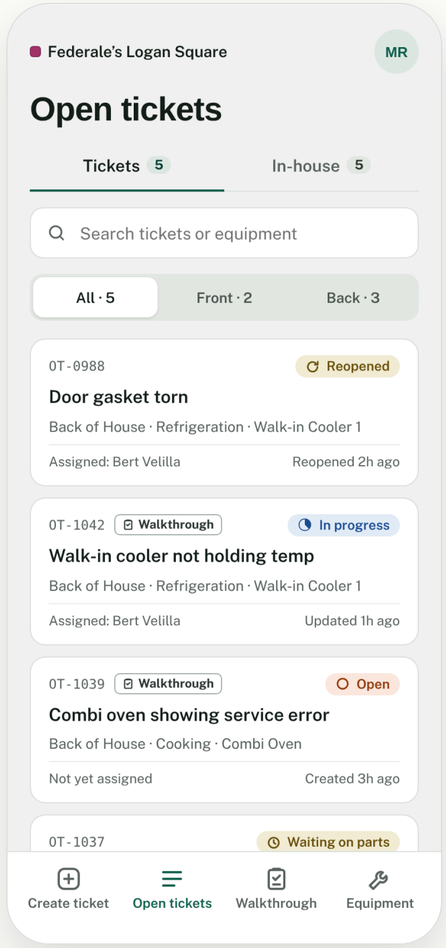

That’s what turns a list of tickets into answers: what each restaurant costs to keep running, which units keep failing, and who you’re paying for what.

HOW TICKETS REACH YOU

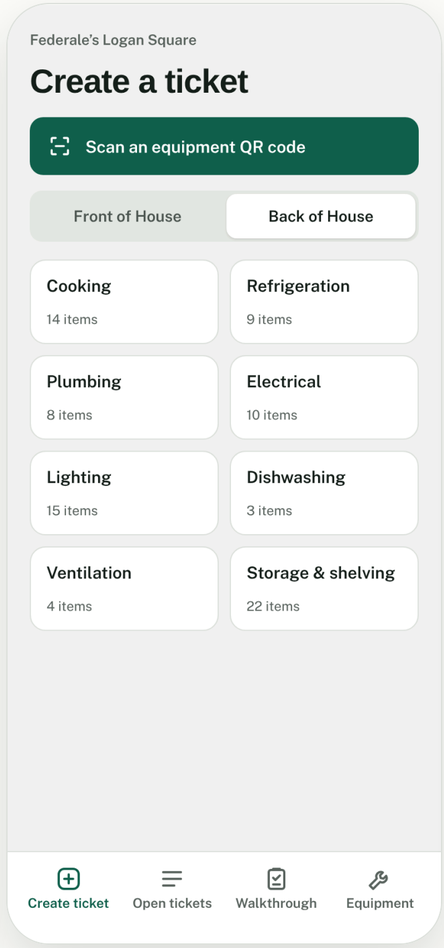

Managers report issues in a few taps

Pick the area, then the category, then describe it. Or scan the unit's QR code to skip ahead.

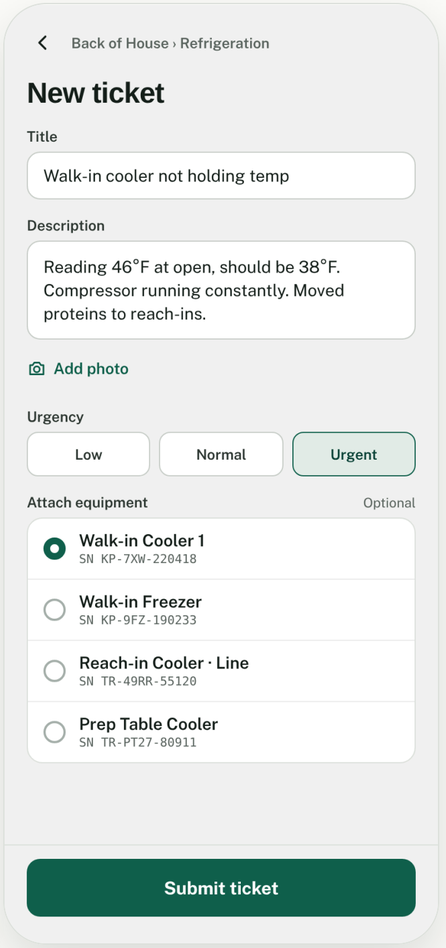

Each manager sees only their restaurant's tickets and status.

Open tickets

Pick a category

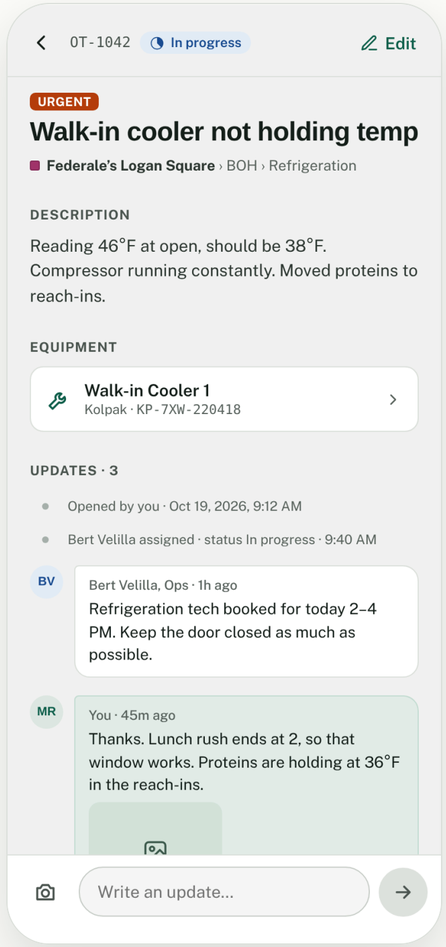

Describe it

NOTHING FALLS THROUGH

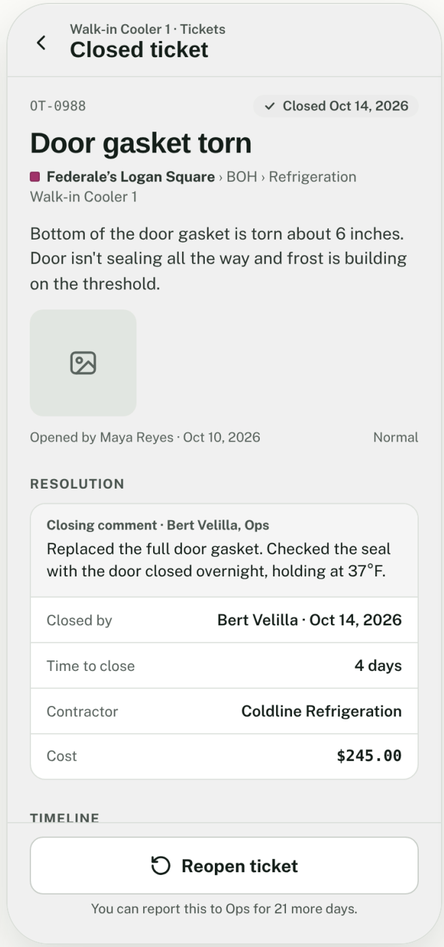

If a fix doesn’t hold, it comes back

Updates and photos stay on the ticket, so no one has to dig through texts.

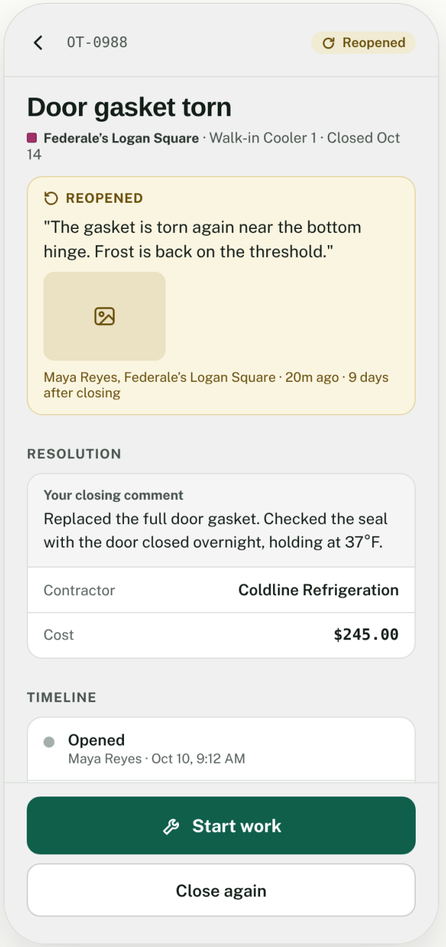

After closing, a manager can reopen it if the problem comes back. Ops decides to start work or close it again, with the original cost and contractor in view.

MONTHLY WALKTHROUGHS

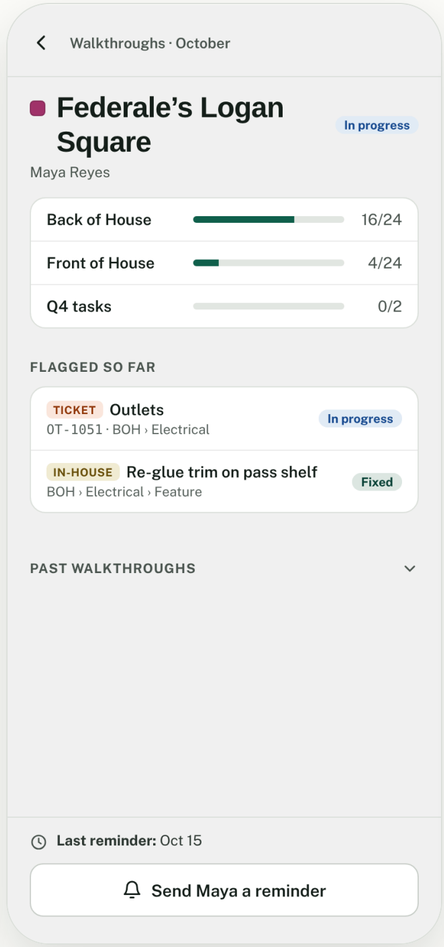

One standard for every restaurant

Managers walk a shared checklist and mark each item good, fix in-house or ticket.

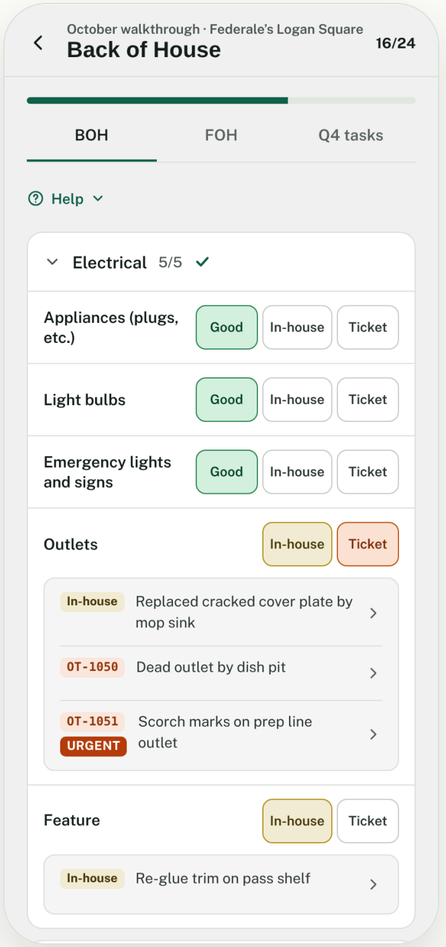

You see who’s on track, who’s behind and what each walkthrough turned up. Its tickets land on your dashboard tagged Walkthrough.

All restaurants

One restaurant

Manager checklist

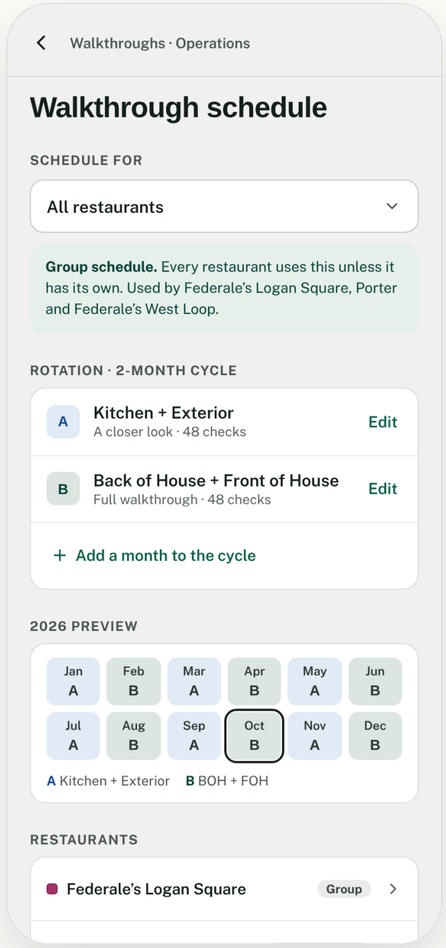

MONTHLY WALKTHROUGHS

Set it once, adjust per restaurant

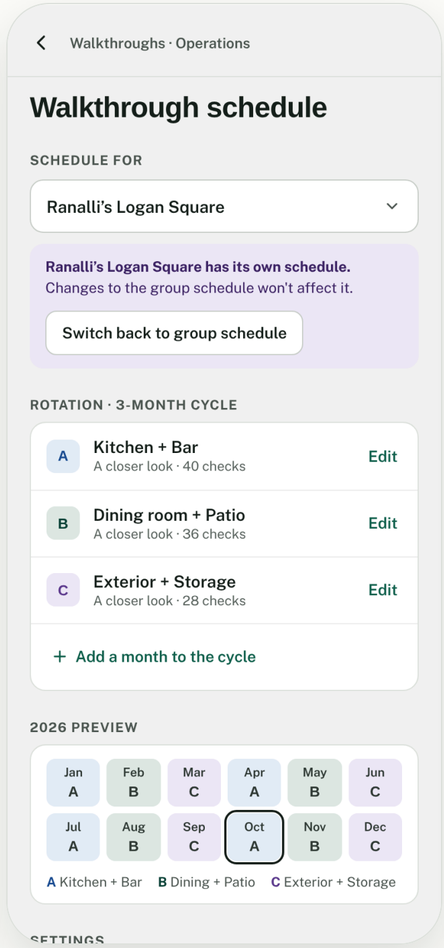

One group schedule rotates what gets a closer look each month, for every restaurant.

Give any restaurant its own rotation, like a bar and patio cycle, and switch it back anytime.

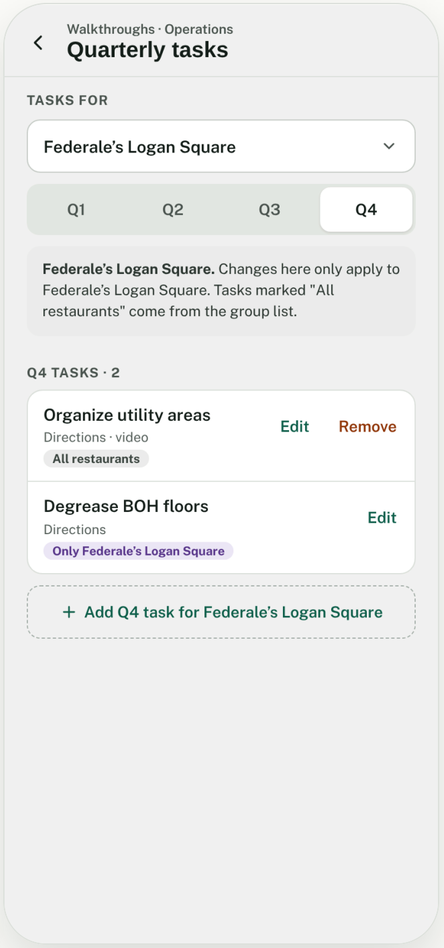

Quarterly tasks can be added, changed or removed for one location without touching the rest.

Group schedule

Its own schedule

Location tasks

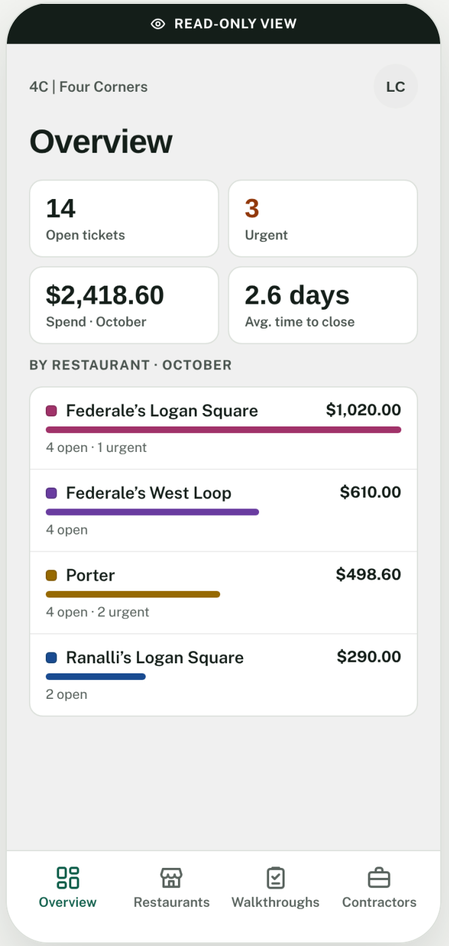

FOR LEADERSHIP

A read-only view of the whole company

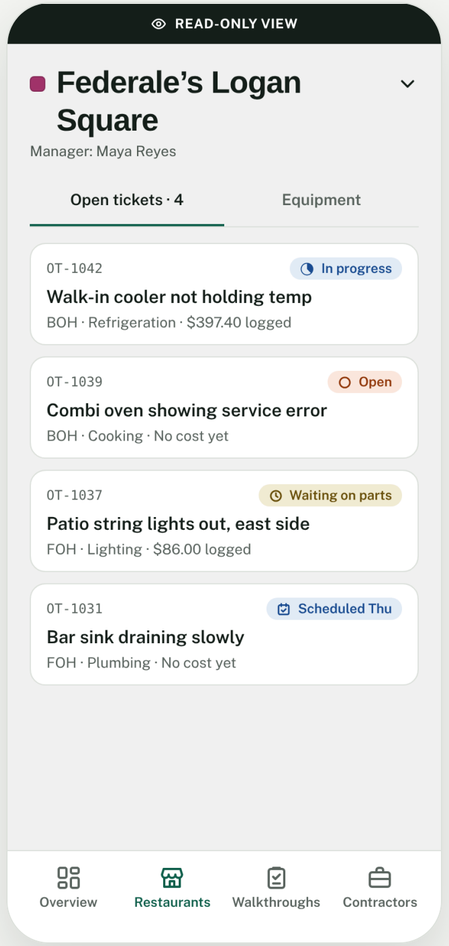

Open and urgent tickets, monthly spend and time to close, broken out by restaurant.

Drill into any restaurant to see what's open and what it has cost.

Nothing to edit, so leadership can look without changing anything.

Overview

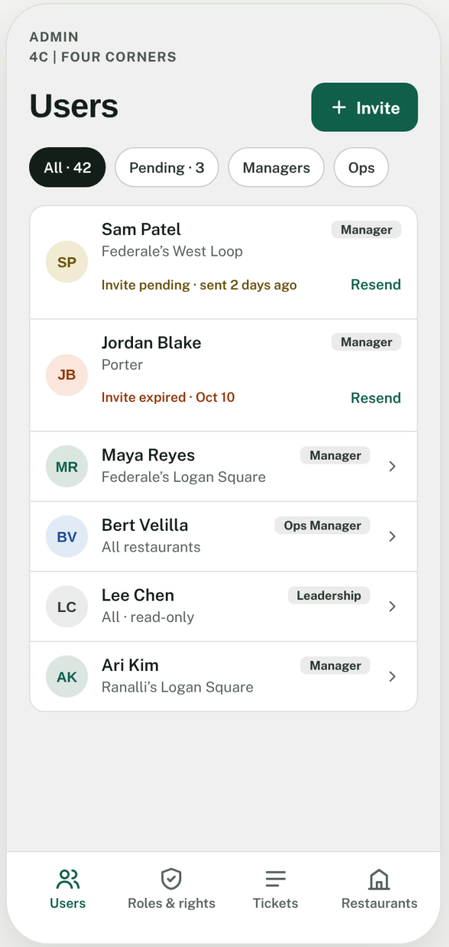

One restaurant

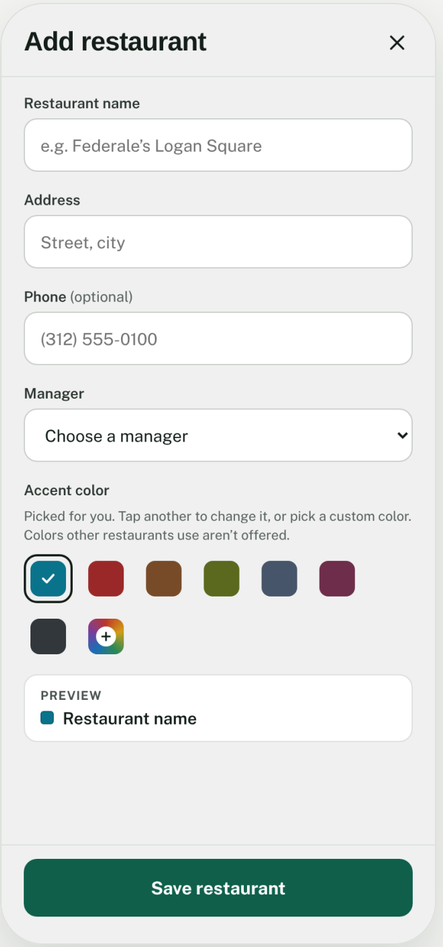

CONTROL AND SETUP

Each role sees what it needs

Role	Can do
Manager	Create tickets and run walkthroughs for their restaurant
Operations	Work every ticket, log cost, manage equipment and contractors
Leadership	See everything, change nothing
Admin	Add restaurants, invite people and set rights

Users

Add restaurant

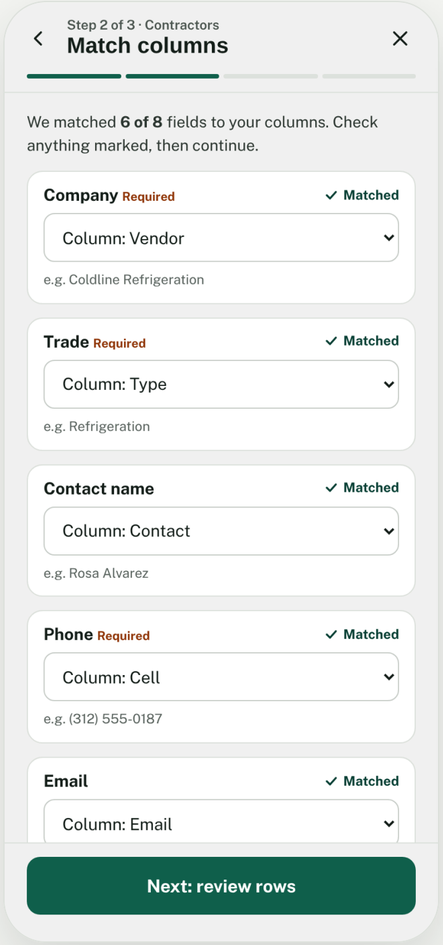

GETTING SET UP

Bring in the lists you already have

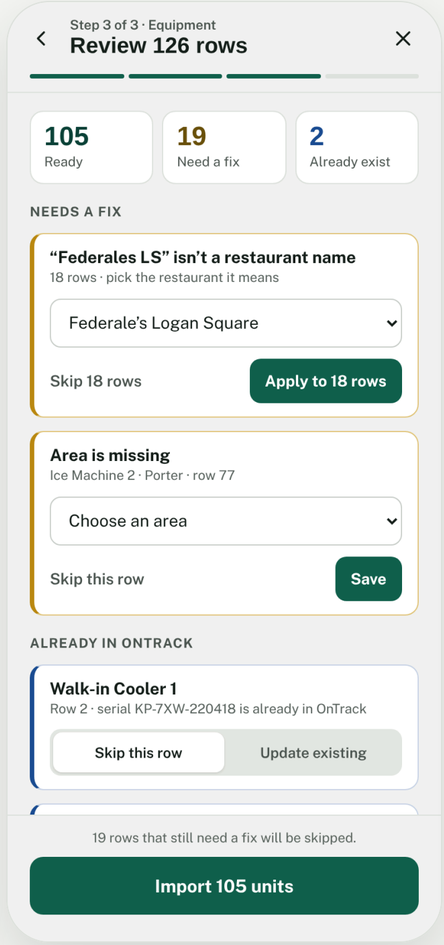

Import contractors and equipment from a spreadsheet, right from a phone.

OnTrack matches the columns, groups problems so one fix covers many rows, and flags anything already in the system.

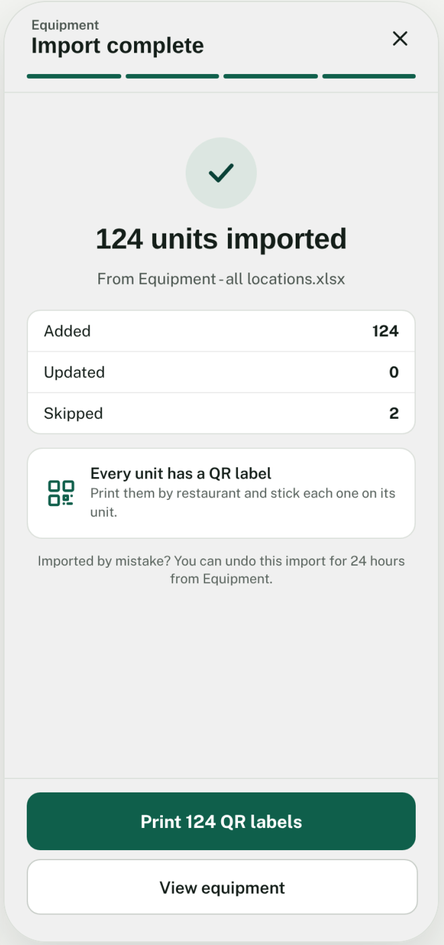

Every imported unit gets a QR label, ready to print.

Match columns

Review rows

Done, print labels

ALSO DESIGNED

About 100 screens, including the details

Everyday edits

Edit or close tickets, add and edit equipment, print QR labels, add contractors, edit service records

States

Loading, empty and no-results screens, offline with queued tickets, save errors, expired links and no-access pages

Accounts

Invites and sign-up, sign-in, password reset, 2-step verification, profile and help

Built mobile first, and the same app works on tablet and desktop too. Every screen is a clickable prototype. Ask for a walkthrough of any part.

NEXT STEPS

Decisions we’d like your input on

1. **Pilot restaurant.** Which one goes first, and for how long.
2. **EcoTrak history.** Bring open tickets over, or start fresh.
3. **Equipment setup.** Who gathers the equipment sheet to import and puts on the QR labels.
4. **Walkthrough checklist.** Which items, and how often.
5. **Contractor list.** A spreadsheet of current vendors to import, and which are preferred.
6. **Feedback.** What’s missing from how your team works today.
